100% Tennessee oak

Dental bridges made of genuine, Tennessee oak are especially suitable for ecologically motivated persons and high-sensitive patients with latent ceramic and metal allergies, since it offers a precise fit with no chemical additives and irritants.

For the realization of this complete denture, the tree was cut down when the moon was waning, since the saps then shift towards the roots and the diameter of the trunk shrinks. The wood is drier and this results in less fissures and joints so that the longevity of the bridge is guaranteed.

In view of the aesthetic aspect, the bridge can also be lime-washed or soaked in beeswax. On special request, the work can also be milled in smoked oak.
